

# ICNS 2019

## Forward

The Fifteenth International Conference on Networking and Services (ICNS 2019), held between June 02, 2019 to June 06, 2019 - Athens, Greece, continued a series of events targeting general networking and services aspects in multi-technologies environments. The conference covered fundamentals on networking and services, and highlights new challenging industrial and research topics. Ubiquitous services, next generation networks, inter-provider quality of service, GRID networks and services, and emergency services and disaster recovery were considered.

IPv6, the Next Generation of the Internet Protocol, has seen over the past three years tremendous activity related to its development, implementation and deployment. Its importance is unequivocally recognized by research organizations, businesses and governments worldwide. To maintain global competitiveness, governments are mandating, encouraging or actively supporting the adoption of IPv6 to prepare their respective economies for the future communication infrastructures. In the United States, government's plans to migrate to IPv6 has stimulated significant interest in the technology and accelerated the adoption process. Business organizations are also increasingly mindful of the IPv4 address space depletion and see within IPv6 a way to solve pressing technical problems. At the same time IPv6 technology continues to evolve beyond IPv4 capabilities. Communications equipment manufacturers and applications developers are actively integrating IPv6 in their products based on market demands.

IPv6 creates opportunities for new and more scalable IP based services while representing a fertile and growing area of research and technology innovation. The efforts of successful research projects, progressive service providers deploying IPv6 services and enterprises led to a significant body of knowledge and expertise. It is the goal of this workshop to facilitate the dissemination and exchange of technology and deployment related information, to provide a forum where academia and industry can share ideas and experiences in this field that could accelerate the adoption of IPv6. The workshop brings together IPv6 research and deployment experts that will share their work. The audience will hear the latest technological updates and will be provided with examples of successful IPv6 deployments; it will be offered an opportunity to learn what to expect from IPv6 and how to prepare for it.

Packet Dynamics refers broadly to measurements, theory and/or models that describe the time evolution and the associated attributes of packets, flows or streams of packets in a network. Factors impacting packet dynamics include cross traffic, architectures of intermediate nodes (e.g., routers, gateways, and firewalls), complex interaction of hardware resources and protocols at various levels, as well as implementations that often involve competing and conflicting requirements.

Parameters such as packet reordering, delay, jitter and loss that characterize the delivery of packet streams are at times highly correlated. Load-balancing at an intermediate node may, for example, result in out-of-order arrivals and excessive jitter, and network congestion may

manifest as packet losses or large jitter. Out-of-order arrivals, losses, and jitter in turn may lead to unnecessary retransmissions in TCP or loss of voice quality in VoIP.

With the growth of the Internet in size, speed and traffic volume, understanding the impact of underlying network resources and protocols on packet delivery and application performance has assumed a critical importance. Measurements and models explaining the variation and interdependence of delivery characteristics are crucial not only for efficient operation of networks and network diagnosis, but also for developing solutions for future networks.

Local and global scheduling and heavy resource sharing are main features carried by Grid networks. Grids offer a uniform interface to a distributed collection of heterogeneous computational, storage and network resources. Most current operational Grids are dedicated to a limited set of computationally and/or data intensive scientific problems.

Optical burst switching enables these features while offering the necessary network flexibility demanded by future Grid applications. Currently ongoing research and achievements refers to high performance and computability in Grid networks. However, the communication and computation mechanisms for Grid applications require further development, deployment and validation.

We welcomed academic, research and industry contributions. The conference had the following tracks:

- NGNUS: Next Generation Networks and Ubiquitous Services
- CGNS: CLOUD/GRID Networks and Services
- COMAN: Network Control and Management

We take here the opportunity to warmly thank all the members of the ICNS 2019 technical program committee, as well as all the reviewers. The creation of such a high quality conference program would not have been possible without their involvement. We also kindly thank all the authors who dedicated much of their time and effort to contribute to ICNS 2019. We truly believe that, thanks to all these efforts, the final conference program consisted of top quality contributions.

We also thank the members of the ICNS 2019 organizing committee for their help in handling the logistics and for their work that made this professional meeting a success.

We hope that ICNS 2019 was a successful international forum for the exchange of ideas and results between academia and industry and to promote further progress in the areas networking and services. We also hope that Athens, Greece provided a pleasant environment during the conference and everyone saved some time to enjoy the historic charm of the city.

## **ICNS 2019 Chairs**

### **ICNS Steering Committee**

Eugen Borcoci, University "Politehnica" of Bucharest (UPB), Romania

Carlos Becker Westphall, Federal University of Santa Catarina, Brazil

Sathiamoorthy Manoharan, University of Auckland, New Zealand

Mary Luz Mouronte López, Universidad Francisco de Vitoria - Madrid, Spain

Massimo Villari, Università di Messina, Italy

Éric Renault, Institut Mines-Télécom - Télécom SudParis, France

Robert Bestak, Czech Technical University in Prague, Czech Republic  
Young-Joo Suh, POSTECH (Pohang University of Science and Technology), Korea  
Gledson Elias, Federal University of Paraíba (UFPB), Brazil  
Rui L.A. Aguiar, University of Aveiro, Portugal  
Ivan Ganchev, University of Limerick, Ireland / Plovdiv University "Paisii Hilendarski", Bulgaria

**ICNS Industry/Research Advisory Committee**

Steffen Fries, Siemens, Germany  
Alex Sim, Lawrence Berkeley National Laboratory, USA  
Jeff Sedayao, Intel Corporation, USA  
Juraj Giertl, T-Systems, Slovakia
